

## 1. Explanation (Word content for 1-page PDF)

**Title:** HTML Newspaper Recreation (Mashriq) — Code Structure Explanation

**Student:** Sana Ullah

**Roll No:** 22P-9038

**Section:** BCS-8B

**Course:** CS-4070 Web Technologies (8th Semester)

**Newspaper:** Mashriq (Lahore Edition)

**Date on Page:** Friday, 2 November 1984

### 1. Overview of Code Structure

This project recreates a pre-1990 Urdu newspaper front page using **HTML only** with **inline styles** (no external CSS and no JavaScript). The file uses a standard HTML5 structure: `<!DOCTYPE html>`, `<html>`, `<head>`, and `<body>`. The page is organized using semantic tags to resemble a real newspaper layout.

### 2. Major Sections (Semantic Layout)

#### A) Header (Masthead) — `<header>`

The `<header>` contains the newspaper masthead layout. It is built using a flexible row that visually imitates a newspaper top bar:

- Left side: city/price block
- Center: masthead logo image + main title (`<h1>`) + date line
- Right side: office/subscription block

A top border line is added below to separate the masthead from the content.

#### B) Navigation Bar — `<nav>` + `<ul>`

A `<nav>` section is included directly below the header. It contains an unordered list `<ul>` to satisfy the “at least one list” requirement. This imitates a newspaper navigation strip (Front Page, National, World, Editorial, Sports).

### C) Lead Story — <section> + <article> + headings

The main breaking news area is wrapped inside a <section> with a dark background to match the original page's high-contrast lead story.

- A large lead text line appears at the top.
- A row below it contains:
  - One portrait image on the left
  - A right-side <article> that includes two short updates in separate <section> blocks and a bold main headline banner.  
Headings follow a hierarchy: <h1> for the newspaper name, then <h2>/<h3>/<h4> internally to keep structure semantic.

### D) Lower Multi-Column Layout — <table>

A <table> is used to create a clear three-column newspaper layout (required in the assignment). Each column is placed inside a <td>:

- Left column: image + short bullet-like text lines (styled blocks)
- Middle column: stacked text boxes and a bordered paragraph
- Right column: black “Mashriq” information box (publication/locations)  
This approach was chosen because tables provide strong column control without external CSS files.

### E) Footer — <footer>

The <footer> contains student details and a short note confirming “HTML-only, no external CSS/JS.” It also visually completes the page with border styling.

### 3. Key Design Decisions

- **Tables for columns:** Used for the lower section to maintain strict column alignment and to satisfy the “at least one table” requirement.
- **Semantic tags:** <header>, <nav>, <section>, <article>, and <footer> were used so the layout is meaningful and easy to explain in viva.
- **Inline styling:** All styling is done with the style="" attribute only, as allowed.

### 4. Challenges Faced

- **Maintaining newspaper-like alignment without external CSS:** Solved by using a mix of table columns and simple flex layouts inside major blocks.
- **Balancing readability and similarity:** Adjusted font sizes, borders, and spacing to achieve good visual similarity while keeping HTML clean and explainable.
